EXPERIMENT 03

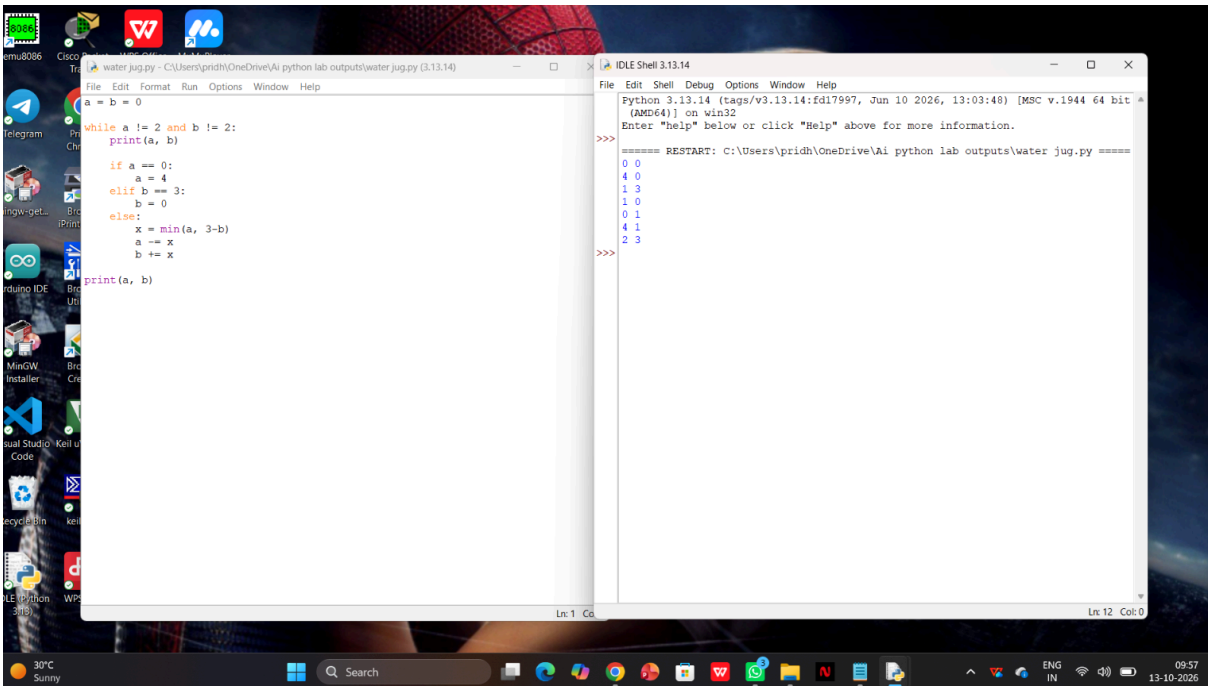

Aim:

To write a Python program to measure a required quantity of water using two jugs of different capacities.

Algorithm:

- Initialize the capacities of the two jugs.
- Start with both jugs empty.
- Generate possible operations: fill, empty, and pour water between jugs.
- Check whether the required quantity is obtained.
- Repeat the operations until the goal is reached.
- Display the solution steps.

Program code and output :

Result:

Thus, the Python program to solve the Water Jug Problem was implemented successfully.
