EXPERIMENT 08

Depth-First Search (DFS)

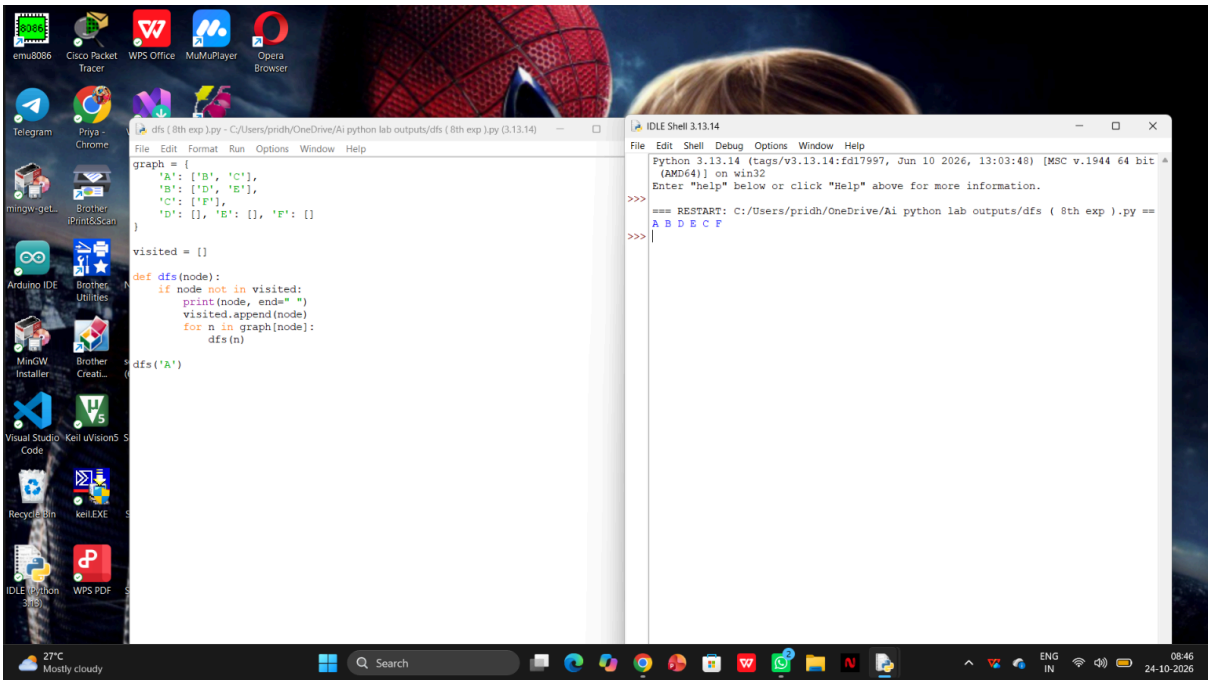

Aim:

To write a Python program to implement Depth-First Search for graph traversal.

Algorithm:

- Create a graph using an adjacency list.
- Start from the selected node.
- Mark the node as visited and display it.
- Visit an unvisited adjacent node.
- Continue exploring deeply before backtracking.
- Stop when all reachable nodes have been visited.

Program output :

Result: Thus, the Python program to implement Depth-First Search was executed successfully.
