EXPERIMENT 09

Travelling Salesman Problem (TSP)

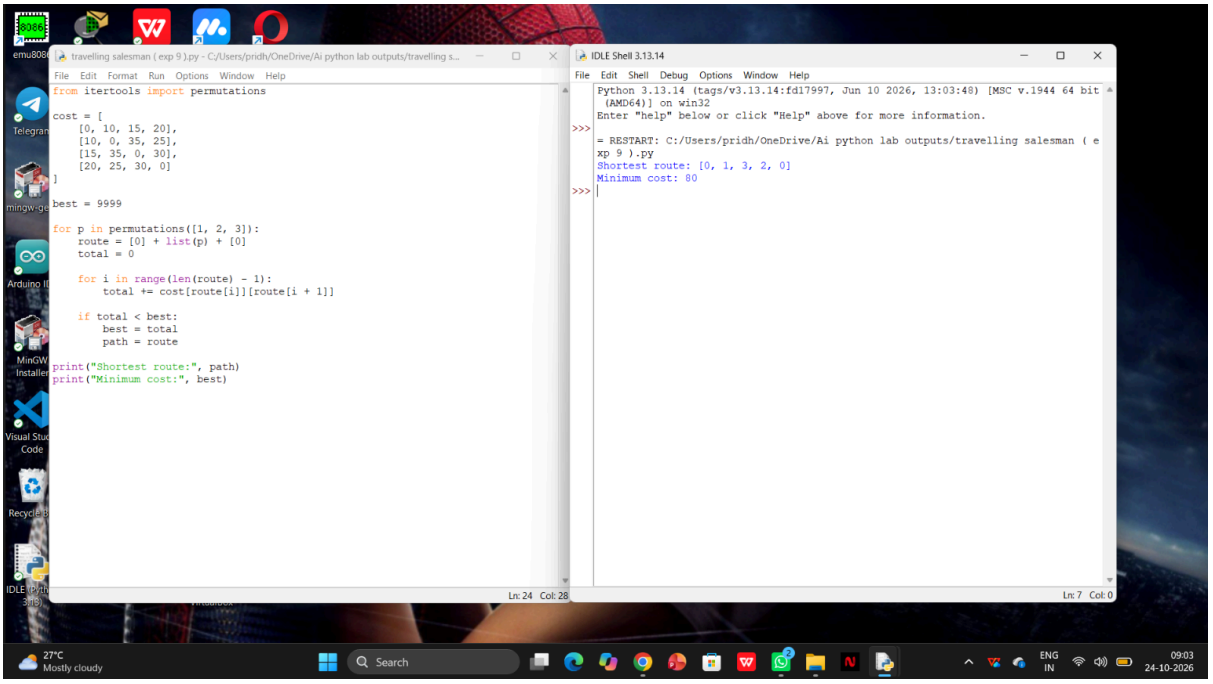

Aim:

To write a Python program to find the shortest possible route that visits every city once and returns to the starting city.

Algorithm:

- Initialize the cities and their travel costs.
- Fix one city as the starting point.
- Generate possible orders for visiting the remaining cities.
- Calculate the total cost of each route.
- Select the route with the minimum cost.
- Display the optimal route and its cost.

Program output :

Result: Thus, the Python program to solve the Travelling Salesman Problem was implemented successfully.
