EXPERIMENT 15

Decision Tree

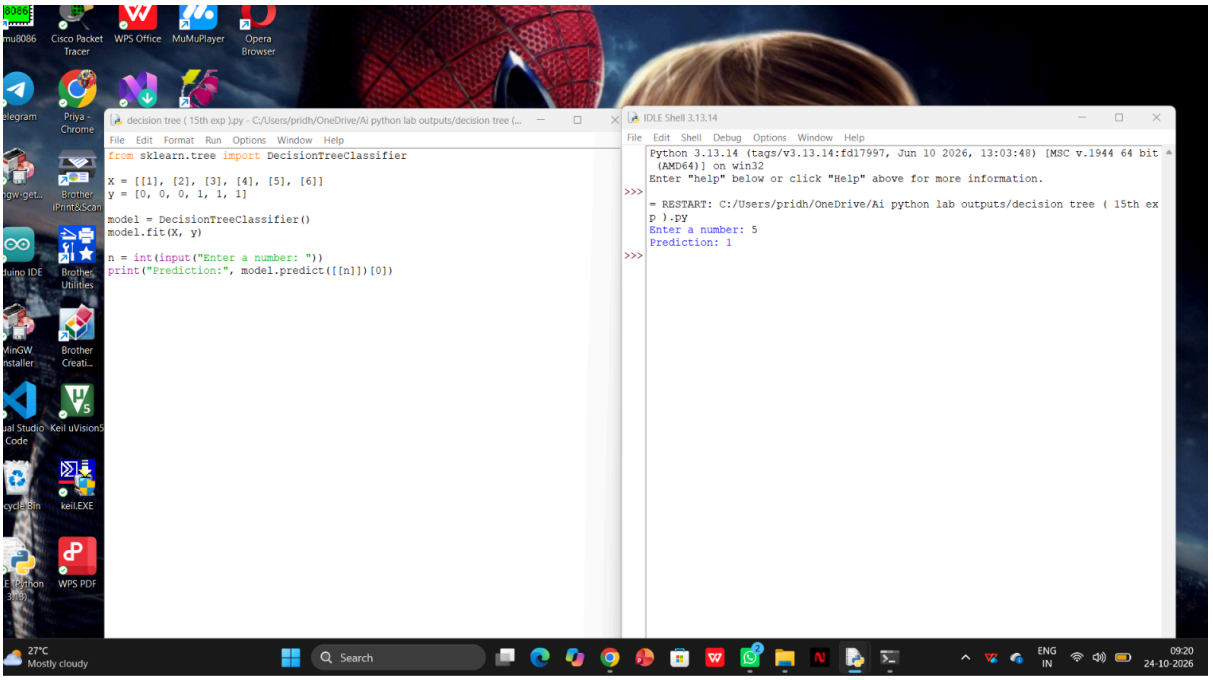

Aim:

To write a Python program to implement a Decision Tree for classification.

Algorithm:

- Import the required machine learning library.
- Prepare the dataset containing input features and target values.
- Divide the dataset into training and testing sets.
- Create and train the Decision Tree classifier.
- Predict the target values for the test data.
- Display the predictions and accuracy.

Program output :

Result: Thus, the Python program to implement the Decision Tree classifier was executed successfully.
